1 Representing Signals

Problem 1. Sketch the following signals

TO SUBMIT

```
a) x(t) = \sin \frac{\pi}{4} t + 20^{\circ}
```

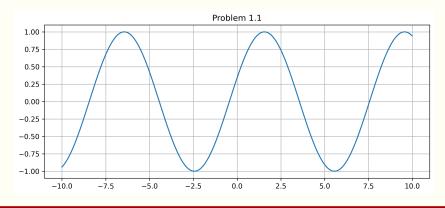

Solution. Using Python and Matplotlib to plot the signal $x(t) = \sin \frac{\pi}{4}t + 20^{\circ}$:

```
import matplotlib.pyplot as plt
import numpy as np

fig = plt.figure()

t = np.arange(-10, 10, 0.01)
x = np.sin(np.pi/4 * t + np.pi/9)

plt.title("Problem 1.1")
plt.plot(t, x)
plt.grid(True)
plt.show()
```

b)
$$x(t) = \begin{cases} t+2, & t \le 2\\ 0, & -2 \le t \le 2\\ t-2, & t \ge 2 \end{cases}$$

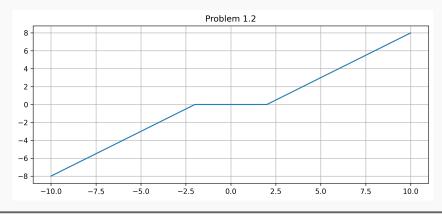

Solution. Using Python and Matplotlib to plot the piecewise signal x(t):

```
import matplotlib.pyplot as plt
import numpy as np

fig = plt.figure(figsize=(10, 4))

t = np.arange(-10, 10, 0.01)
x = np.piecewise(t, [t < -2, (t >= -2) & (t < 2), t >= 2], [lambda t: t + 2, 0, lambda t: t - 2])

plt.title("Problem 1.2")
plt.plot(t, x)
plt.grid(True)
plt.show()
```

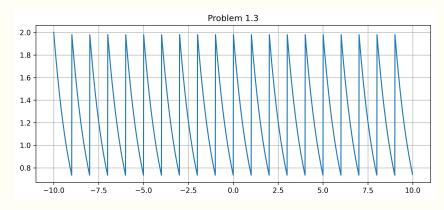

TO SUBMIT

```
c) x(t) = 2e^{-t}, 0 \le t < 1 \text{ and } x(t+1) = x(t), \forall t
```

Solution. Using Python and Matplotlib to plot the piecewise signal $x(t) = 2e^{-t}, 0 \le t < 1$ and $x(t+1) = x(t), \forall t$:

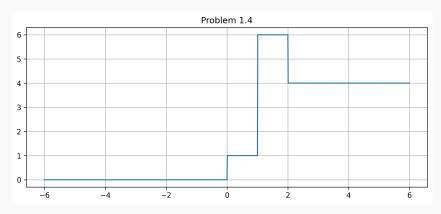

```
import matplotlib.pyplot as plt
2 import numpy as np
  def x3(t):
      if t >= 1:
         return x3(t-1)
     if t < 0:
         return x3(t + 1)
     return 2 * (np.e ** (-t))
9
fig = plt.figure(figsize=(10, 4))
12
t = np.arange(-10, 10, 0.01)
x3_vectorize = np.vectorize(x3)
x = x3_{vectorize}(t)
plt.title("Problem 1.3")
plt.plot(t, x)
19 plt.grid(True)
plt.show()
```

```
d) x(t) = u(t) + 5u(t-1) + 2u(t-2)
```

Solution. Using Python and Matplotlib to plot the piecewise signal x(t) = u(t) + 5u(t-1) + 2u(t-2):

```
import matplotlib.pyplot as plt
2 import numpy as np
def unit_signal(t):
      return 1.0 if t \ge 0 else 0.0
vunit_signal_vectorize = np.vectorize(unit_signal)
9 fig = plt.figure(figsize=(10, 4))
t = np.arange(-6, 6, 0.01)
12
u1 = unit_signal_vectorize(t)
u2 = unit_signal_vectorize(t - 1)
u3 = unit_signal_vectorize(t - 2)
16
x = u1 + 5 * u2 - 2 * u3
18
plt.title("Problem 1.4")
plt.plot(t, x)
plt.grid(True)
plt.show()
```

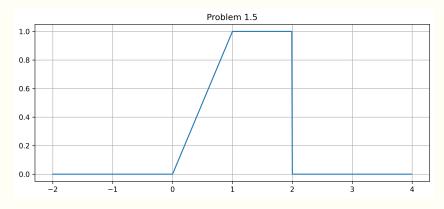

TO SUBMIT

```
e) x(t) = r(t) - r(t-1) - u(t-2)
```

Solution. Using Python and Matplotlib to plot the piecewise signal x(t) = r(t) - r(t - 1) - u(t - 2):

```
import matplotlib.pyplot as plt
  import numpy as np
  def unit_signal(t):
      return 1.0 if t \ge 0 else 0.0
  def ramp_signal(t):
      return t * unit_signal(t)
unit_signal_vectorize = np.vectorize(unit_signal)
ramp_signal_vectorize = np.vectorize(ramp_signal)
12
fig = plt.figure(figsize=(10, 4))
14
t = np.arange(-2, 4, 0.01)
r1 = ramp_signal_vectorize(t)
r2 = ramp_signal_vectorize(t - 1)
u1 = unit_signal_vectorize(t - 2)
20
  x = r1 - r2 - u1
21
22
plt.title("Problem 1.5")
24 plt.plot(t, x)
25 plt.grid(True)
plt.show()
```

Problem 2. Determine whether each of following signals is periodic, and if so, find its period.

a)
$$x(t) = \sin\left(\frac{\pi}{3}t\right) + \cos\left(\frac{8\pi}{3}t\right)$$

Solution. Consider each part of the signal separately:

$$\sin\left(\frac{\pi}{3}t\right)$$
 has a period of $T_1 = \frac{2\pi}{\frac{\pi}{3}} = 6$

$$\cos\left(\frac{8\pi}{3}t\right)$$
 has a period of $T_2 = \frac{2\pi}{\frac{8\pi}{3}} = \frac{3}{4}$

Considering the least common multiple of the two periods:

$$T = \text{lcm}(T_1, T_2) = \text{lcm}(6, \frac{3}{4}) = 6$$

Thus, the signal $x(t) = \sin\left(\frac{\pi}{3}t\right) + \cos\left(\frac{8\pi}{3}t\right)$ is **periodic** with a period of T = 6.

By using Python and Matplotlib, we can visualize the periodicity of the signal:

```
import matplotlib.pyplot as plt
import numpy as np

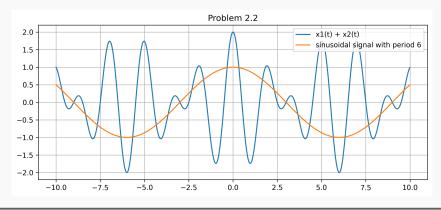

fig = plt.figure(figsize=(10, 4))

t = np.arange(-10, 10, 0.01)

x1 = np.sin(np.pi/3 * t)
x2 = np.cos(8*np.pi/3 * t)

x = np.sin(np.pi/3 * t)

plt.title("Problem 2.1")
plt.plot(t, x1 + x2, label="x1(t) + x2(t)")
plt.plot(t, x, label="sinusoidal signal with period 6")
plt.grid(True)
plt.legend(loc="upper right")
plt.show()
```

b)
$$x(t) = \exp(j\frac{7\pi}{6}t) + \exp(j\frac{5\pi}{6}t)$$

Solution. Consider each part of the signal separately:

$$\exp\left(j\frac{7\pi}{6}t\right)$$
 has a period of $T_1=\frac{2\pi}{\frac{7\pi}{6}}=\frac{12}{7}$

$$\exp\left(j\frac{5\pi}{6}t\right)$$
 has a period of $T_2 = \frac{2\pi}{\frac{5\pi}{6}} = \frac{12}{5}$

Considering the least common multiple of the two periods:

$$T = \operatorname{lcm}(T_1, T_2) = \operatorname{lcm}\left(\frac{12}{7}, \frac{12}{5}\right) = \frac{12}{1} = 12$$

Thus, the signal $x(t) = \exp\left(j\frac{7\pi}{6}t\right) + \exp\left(j\frac{5\pi}{6}t\right)$ is **periodic** with a period of T = 12

By using Python and Matplotlib, we can visualize the periodicity of the signal:

```
import matplotlib.pyplot as plt
import numpy as np

fig = plt.figure(figsize=(10, 4))

t = np.arange(-20, 20, 0.01)

x1 = np.exp(1j * 7*np.pi/6 * t)

x2 = np.exp(1j * 5*np.pi/6 * t)

x = np.exp(1j * np.pi/6 * t)

plt.title("Problem 2.2")

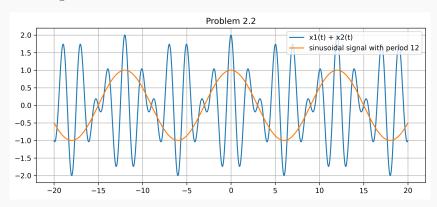

plt.plot(t, x1 + x2, label="x1(t) + x2(t)")

plt.plot(t, x, label="sinusoidal signal with period 12")

plt.grid(True)

plt.legend(loc="upper right")

plt.show()
```

c)
$$x(t) = \exp\left(j\frac{7\pi}{6}t\right) + \exp\left(\frac{5\pi}{6}t\right)$$

Solution. Consider each part of the signal separately:

$$\exp\left(j\frac{7\pi}{6}t\right)$$
 has a period of $T_1 = \frac{2\pi}{\frac{7\pi}{6}} = \frac{12}{7}$

 $\exp\left(\frac{5\pi}{6}t\right)$ has no period since it is not a sinusoidal function. (non-periodic signal)

Thus, the signal $x(t) = \exp\left(j\frac{7\pi}{6}t\right) + \exp\left(\frac{5\pi}{6}t\right)$ is non-periodic since one part of the signal is non-periodic.

By using Python and Matplotlib, we can visualize the signal:

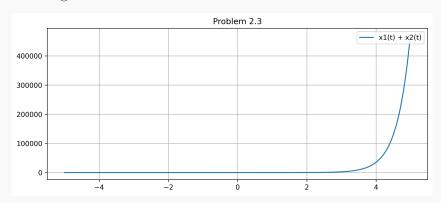

```
import matplotlib.pyplot as plt
import numpy as np

fig = plt.figure(figsize=(10, 4))

t = np.arange(-5, 5, 0.01)

x1 = np.exp(1j * 7*np.pi/6 * t)
x2 = np.exp(5*np.pi/6 * t)

plt.title("Problem 2.3")
plt.plot(t, x1 + x2, label="x1(t) + x2(t)")
plt.grid(True)
plt.legend(loc="upper right")
plt.show()
```

Problem 3. Determine whether the following signals are power or energy signals or neither. Justify your answers

a)
$$x(t) = A\sin(t), -\infty < t < \infty$$

Solution. Consider the energy of the signal:

$$E = \lim_{N \to \infty} \int_{-N}^{N} |x(t)|^2 dt$$

$$= \lim_{N \to \infty} \int_{-N}^{N} |A\sin(t)|^2 dt$$

$$= \lim_{N \to \infty} A^2 \int_{-N}^{N} \sin^2(t) dt$$

$$= \lim_{N \to \infty} A^2 \int_{-N}^{N} \frac{1 - \cos(2t)}{2} dt$$

$$= \lim_{N \to \infty} \frac{A^2}{2} \left[t - \frac{\sin(2t)}{2} \right]_{-N}^{N}$$

$$= \lim_{N \to \infty} \frac{A^2}{2} (N - (-N))$$

$$= \lim_{N \to \infty} A^2 N$$

$$E = \infty$$

The integral diverges, so the energy is infinite.

Now, consider the power of the signal:

$$\begin{split} P &= \lim_{N \to \infty} \frac{1}{2N} \int_{-N}^{N} |x(t)|^2 dt \\ &= \lim_{N \to \infty} \frac{1}{2N} A^2 N \\ P &= \frac{A^2}{2} \end{split}$$

The integral converges to a finite value, so the power is finite.

Thus, the signal $x(t) = A\sin(t)$ is **a power signal** with power $P = \frac{A^2}{2}$

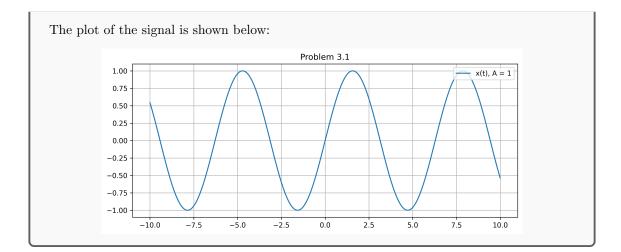

By using Python and Matplotlib, we can visualize the signal:

```
import matplotlib.pyplot as plt
import numpy as np

fig = plt.figure(figsize=(10, 4))

t = np.arange(-10, 10, 0.01)
x = np.sin(t)

plt.title("Problem 3.1")
plt.plot(t, x, label="x(t), A = 1")
plt.grid(True)
plt.legend(loc="upper right")
plt.show()
```

b)
$$x(t) = A(u(t-a) - u(t+a)), a > 0$$

Solution. Consider the energy of the signal:

$$\begin{split} E &= \lim_{N \to \infty} \int_{-N}^{N} |x(t)|^2 dt \\ &= \lim_{N \to \infty} \int_{-N}^{N} |A(u(t-a) - u(t+a))|^2 dt \\ &= \lim_{N \to \infty} A^2 \int_{-N}^{N} |u(t-a) - u(t+a)|^2 dt \\ &= \lim_{N \to \infty} A^2 \int_{-N}^{N} (u(t-a) - u(t+a))^2 dt \\ &= \lim_{N \to \infty} A^2 \int_{-N}^{N} (u(t+a) - u(t-a)) dt \\ &= \lim_{N \to \infty} A^2 \int_{-a}^{a} 1 dt \\ &= \lim_{N \to \infty} A^2 (a - (-a)) \end{split}$$

The integral converges to a finite value, so the energy is finite.

Now, consider the power of the signal:

$$\begin{split} P &= \lim_{N \to \infty} \frac{1}{2N} \int_{-N}^{N} |x(t)|^2 dt \\ &= \lim_{N \to \infty} \frac{1}{2N} 2aA^2 \\ P &= 0 \end{split}$$

The integral converges to 0, so the power is 0.

Thus, the signal x(t) = A(u(t-a) - u(t+a)) is **a energy signal** with energy $E = 2aA^2$ By using Python and Matplotlib, we can visualize the signal:

```
import matplotlib.pyplot as plt
import numpy as np

def unit_signal(t):
    return 1.0 if t >= 0 else 0.0

unit_signal_vectorize = np.vectorize(unit_signal)

fig = plt.figure(figsize=(10, 4))

t = np.arange(-4, 4, 0.01)

x = unit_signal_vectorize(t - 1) - unit_signal_vectorize(t + 1)

plt.title("Problem 3.2")

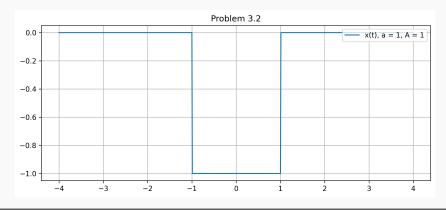

plt.plot(t, x, label="x(t), a = 1, A = 1")

plt.grid(True)

plt.legend(loc="upper right")

plt.show()
```

The plot of the signal is shown below:

c)
$$x(t) = \exp(-at)u(t), a > 0$$

Solution. Consider the energy of the signal:

$$E = \lim_{N \to \infty} \int_{-N}^{N} |x(t)|^2 dt$$

$$= \lim_{N \to \infty} \int_{-N}^{N} |\exp(-at)u(t)|^2 dt$$

$$= \lim_{N \to \infty} \int_{0}^{N} |\exp(-at)|^2 dt$$

$$= \lim_{N \to \infty} \int_{0}^{N} \exp(-2at) dt$$

$$= \lim_{N \to \infty} \left[-\frac{1}{2a} \exp(-2at) \right]_{0}^{N}$$

$$= \lim_{N \to \infty} \left(-\frac{1}{2a} \exp(-2aN) + \frac{1}{2a} \right)$$

$$E = \frac{1}{2a}$$

The integral converges to a finite value, so the energy is finite.

Now, consider the power of the signal:

$$P = \lim_{N \to \infty} \frac{1}{2N} \int_{-N}^{N} |x(t)|^2 dt$$
$$= \lim_{N \to \infty} \frac{1}{2N} \frac{1}{2a}$$
$$P = 0$$

The integral converges to 0, so the power is 0.

Thus, the signal $x(t) = \exp(-at)u(t)$, a > 0 is **a energy signal** with energy $E = \frac{1}{2a}$

By using Python and Matplotlib, we can visualize the signal:

```
import matplotlib.pyplot as plt
import numpy as np

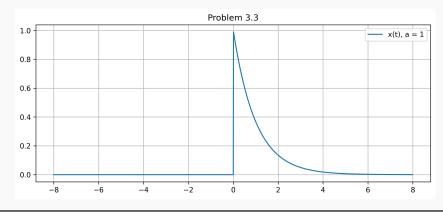

def unit_signal(t):
    return 1.0 if t >= 0 else 0.0

unit_signal_vectorize = np.vectorize(unit_signal)

fig = plt.figure(figsize=(10, 4))

t = np.arange(-8, 8, 0.01)
    x = np.exp(-t) * unit_signal_vectorize(t)

plt.title("Problem 3.3")
    plt.plot(t, x, label="x(t), a = 1")
    plt.grid(True)
    plt.legend(loc="upper right")
    plt.show()
```

d)
$$x(t) = A \exp(bt)u(t), b > 0$$

Solution. Consider the energy of the signal:

$$E = \lim_{N \to \infty} \int_{-N}^{N} |x(t)|^2 dt$$

$$= \lim_{N \to \infty} \int_{-N}^{N} |A \exp(bt)u(t)|^2 dt$$

$$= \lim_{N \to \infty} \int_{0}^{N} |A \exp(bt)|^2 dt$$

$$= \lim_{N \to \infty} \int_{0}^{N} A^2 \exp(2bt) dt$$

$$= \lim_{N \to \infty} A^2 \left[\frac{1}{2b} \exp(2bt) \right]_{0}^{N}$$

$$= \lim_{N \to \infty} A^2 \left(\frac{1}{2b} \exp(2bN) - \frac{1}{2b} \right)$$

$$E = \infty$$

The integral diverges, so the energy is infinite.

Now, consider the power of the signal:

$$P = \lim_{N \to \infty} \frac{1}{2N} \int_{-N}^{N} |x(t)|^2 dt$$
$$= \lim_{N \to \infty} \frac{1}{2N} A^2 \left(\frac{1}{2b} \exp(2bN) - \frac{1}{2b} \right)$$
$$P = \infty$$

The integral diverges, so the power is infinite.

Thus, the signal $x(t) = A \exp(bt)u(t)$, b > 0 is neither a energy nor a power signal

By using Python and Matplotlib, we can visualize the signal:

```
import matplotlib.pyplot as plt
import numpy as np

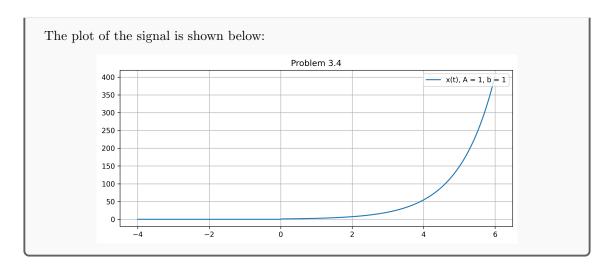

def unit_signal(t):
    return 1.0 if t >= 0 else 0.0

unit_signal_vectorize = np.vectorize(unit_signal)

fig = plt.figure(figsize=(10, 4))

t = np.arange(-4, 6, 0.01)
x = np.exp(t) * unit_signal_vectorize(t)

plt.title("Problem 3.4")
plt.plot(t, x, label="x(t), A = 1, b = 1")
plt.grid(True)
plt.legend(loc="upper right")
plt.show()
```

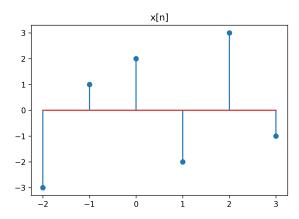

Problem 4. For the discrete time signal x[n] shown in Figure below, sketch each of the following

```
import matplotlib.pyplot as plt
import numpy as np

fig = plt.figure(figsize=(6, 4))

t = np.arange(-2, 4)
x_t = np.array([-3, 1, 2, -2, 3, -1])

plt.stem(t, x_t)
plt.title('x[n]')
plt.show()
```

Solution. By using Python, we can create a function to transform the signal based on the given transformation function:

TO SUBMIT

```
a) x[2-n]
```

Solution. Using Python and Matplotlib to plot the signal x[2-n]:

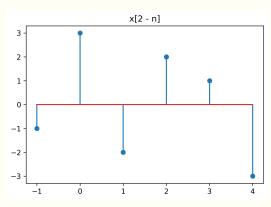

```
import matplotlib.pyplot as plt
import numpy as np

fig = plt.figure(figsize=(6, 4))

t = np.arange(-2, 4)
x_t = np.array([-3, 1, 2, -2, 3, -1])

x_t, t = transform_signal(x_t, t, lambda x: 2 - x)

plt.stem(t, x_t)
plt.title("x[2 - n]")
plt.show()
```

b) x[3n-4]

```
Solution. Using Python and Matplotlib to plot the signal x[3n-4]:

import matplotlib.pyplot as plt
import numpy as np

fig = plt.figure(figsize=(6, 4))

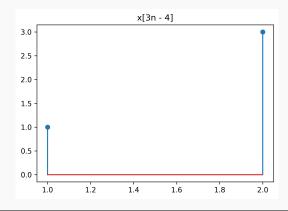

t = np.arange(-2, 4)

x_t = np.array([-3, 1, 2, -2, 3, -1])

x_t, t = transform_signal(x_t, t, lambda x: (x + 4) / 3)

plt.stem(t, x_t)
plt.title("x[3n - 4]")
plt.show()
```

With the resulting plot shown below:

TO SUBMIT

```
c) x \left[ \frac{2}{3}n + 1 \right]
```

Solution. Using Python and Matplotlib to plot the signal $x[\frac{2}{3}n+1]$:

```
import matplotlib.pyplot as plt
import numpy as np

fig = plt.figure(figsize=(6, 4))

t = np.arange(-2, 4)

x_t = np.array([-3, 1, 2, -2, 3, -1])

x_t, t = transform_signal(x_t, t, lambda x: (x - 1) * 3 / 2)

plt.stem(t, x_t)
plt.title("x[(2/3)n + 1]")
plt.show()
```

With the resulting plot shown below: x[(2/3)n + 1]

d) $x \left[-\frac{n+8}{4} \right]$

Solution. Using Python and Matplotlib to plot the signal $x \left[-\frac{n+8}{4} \right]$:

```
import matplotlib.pyplot as plt
import numpy as np

fig = plt.figure(figsize=(6, 4))

t = np.arange(-2, 4)

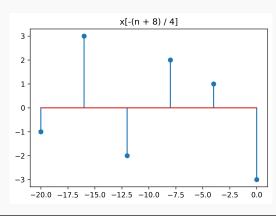

x_t = np.array([-3, 1, 2, -2, 3, -1])

x_t, t = transform_signal(x_t, t, lambda x: (-4 * x) - 8)

plt.stem(t, x_t)

plt.title("x[-(n + 8) / 4]")

plt.show()
```

TO SUBMIT

e) $x[n^3]$

Solution. Using Python and Matplotlib to plot the signal $x[n^3]$:

```
import matplotlib.pyplot as plt
import numpy as np

fig = plt.figure(figsize=(6, 4))

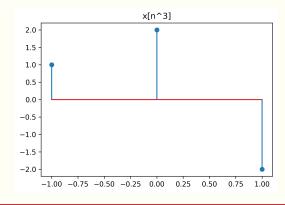

t = np.arange(-2, 4)

x_t = np.array([-3, 1, 2, -2, 3, -1])

x_t, t = transform_signal(x_t, t, lambda x: np.cbrt(x))

plt.stem(t, x_t)
plt.title("x[n^3]")
plt.show()
```

With the resulting plot shown below:

f) x[2-n] + x[3n-4]

```
Solution. Introduce a helper function to add two signals:

def add_discrete_signals(x1, t1, x2, t2):
    """Return x1[n] + x2[n] for any discrete-time signals
    x1[n] and x2[n]."""
    t = np.union1d(t1, t2)
    x = np.zeros(t.shape[0], dtype=float)

for i, val in enumerate(t):
    if val in t1:
        x[i] += x1[np.where(t1 == val)[0][0]]
    if val in t2:
        x[i] += x2[np.where(t2 == val)[0][0]]

return x, t
```

Using Python and Matplotlib to plot the signal $x[n^3]$:

```
import matplotlib.pyplot as plt
import numpy as np

fig = plt.figure(figsize=(6, 4))

t = np.arange(-2, 4)

x_t = np.array([-3, 1, 2, -2, 3, -1])

x_t_1, t_1 = transform_signal(x_t, t, lambda x: 2 - x)

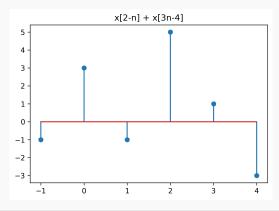

x_t_2, t_2 = transform_signal(x_t, t, lambda x: (x + 4) / 3)

x_t, t = add_discrete_signals(x_t_1, t_1, x_t_2, t_2)

plt.stem(t, x_t)

plt.title("x[2-n] + x[3n-4]")

plt.show()
```

Problem 5. Determine whether each of following signals is periodic, and if so, find its period.

a)
$$x[n] = \sin(\frac{\pi n}{4} + \frac{\pi}{8})$$

Solution. Consider the signal:

$$\sin\left(\frac{\pi n}{4} + \frac{\pi}{8}\right)$$
 has a period of $N = \frac{2\pi}{\frac{\pi}{4}} = 8$

Thus, the signal $x[n] = \sin\left(\frac{\pi n}{4} + \frac{\pi}{8}\right)$ is **periodic** with a period of N = 8.

By using Python and Matplotlib, we can visualize the periodicity of the signal:

```
import matplotlib.pyplot as plt
import numpy as np

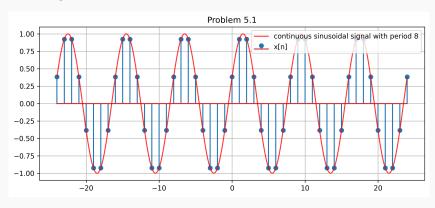

fig = plt.figure(figsize=(10, 4))

t = np.arange(-24, 25, 1)
x = np.sin(np.pi/4 * t + np.pi/8)

tc = np.arange(-24, 24, 0.01)
xc = np.sin(np.pi/4 * tc + np.pi/8)

plt.title("Problem 5.1")
plt.stem(t, x, label="x[n]")
plt.plot(tc, xc, "r", alpha=0.8, label="continuous sinusoidal signal with period 8")

plt.legend(loc="upper right")
plt.show()
```

b)
$$x[n] = \sin\left(\frac{3\pi n}{4}\right) + \sin\left(\frac{\pi}{3}n\right)$$

Solution. Consider the signal:

$$\sin\left(\frac{3\pi n}{4}\right)$$
 has a period of $N_1 = \frac{2\pi}{\frac{3\pi}{4}} = \frac{8}{3}$

$$\sin\left(\frac{\pi n}{3}\right)$$
 has a period of $N_2 = \frac{2\pi}{\frac{\pi}{3}} = 6$

Considering the least common multiple of the two periods:

$$N = \operatorname{lcm}(N_1, N_2) = \operatorname{lcm}\left(\frac{8}{3}, 6\right) = \operatorname{lcm}\left(\frac{8}{3}, \frac{18}{3}\right) = \frac{72}{3} = 24$$

Thus, the signal $x[n] = \sin\left(\frac{3\pi n}{4}\right) + \sin\left(\frac{\pi}{3}n\right)$ is **periodic** with a period of N = 24.

By using Python and Matplotlib, we can visualize the periodicity of the signal:

```
import matplotlib.pyplot as plt
import numpy as np

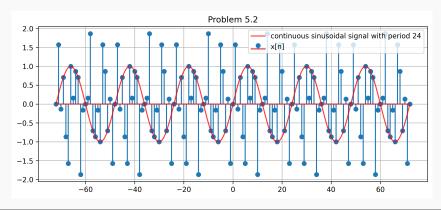

fig = plt.figure(figsize=(10, 4))

t = np.arange(-72, 73, 1)
x = np.sin(3 * np.pi/4 * t) + np.sin(np.pi/3 * t)

tc = np.arange(-72, 72, 0.01)
xc = np.sin(np.pi/12 * tc)

plt.title("Problem 5.2")
plt.stem(t, x, label="x[n]")
plt.plot(tc, xc, "r", alpha=0.8, label="continuous sinusoidal signal with period 24")

plt.grid(True)
plt.legend(loc="upper right")
plt.show()
```

c)
$$x[n] = \sin\left(\frac{3\pi n}{4}\right)\sin\left(\frac{\pi}{3}n\right)$$

Solution. Using the product-to-sum identities, we can rewrite the signal as:

$$x[n] = \sin\left(\frac{3\pi n}{4}\right)\sin\left(\frac{\pi}{3}n\right) = \frac{1}{2}\left[\cos\left(\frac{3\pi n}{4} - \frac{\pi n}{3}\right) - \cos\left(\frac{3\pi n}{4} + \frac{\pi n}{3}\right)\right]$$

Consider the signal:

$$\cos\left(\frac{3\pi n}{4} - \frac{\pi n}{3}\right) = \cos\left(\frac{5\pi n}{12}\right)$$
 has a period of $N_1 = \frac{2\pi}{\frac{5\pi}{12}} = \frac{24}{5}$

$$\cos\left(\frac{3\pi n}{4} + \frac{\pi n}{3}\right) = \cos\left(\frac{13\pi n}{12}\right) \text{ has a period of } N_2 = \frac{2\pi}{\frac{13\pi}{12}} = \frac{24}{13}$$

Considering the least common multiple of the two periods:

$$N = \text{lcm}(N_1, N_2) = \text{lcm}\left(\frac{24}{5}, \frac{24}{13}\right) = \frac{24}{\gcd(5, 13)} = 24$$

Thus, the signal $x[n] = \sin\left(\frac{3\pi n}{4}\right) \sin\left(\frac{\pi}{3}n\right)$ is **periodic** with a period of N = 24.

By using Python and Matplotlib, we can visualize the periodicity of the signal:

```
import matplotlib.pyplot as plt
import numpy as np

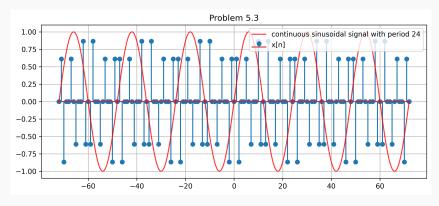

fig = plt.figure(figsize=(10, 4))

t = np.arange(-72, 73, 1)
x = np.sin(3 * np.pi/4 * t) * np.sin(np.pi/3 * t)

tc = np.arange(-72, 72, 0.01)
xc = np.sin(np.pi/12 * tc)

plt.title("Problem 5.3")
plt.stem(t, x, label="x[n]")
plt.plot(tc, xc, "r", alpha=0.8, label="continuous sinusoidal signal with period 24")

plt.grid(True)
plt.legend(loc="upper right")
plt.show()
```

 $\mathbf{d)} \quad x[n] = \exp\left(\frac{6\pi}{5}n\right)$

Solution.

Consider the signal, this is a exponential signal, which have not imaginary part, thus it is not periodic.

By using Python and Matplotlib, we can visualize the periodicity of the signal:

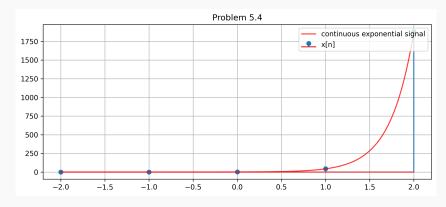

```
import matplotlib.pyplot as plt
import numpy as np

fig = plt.figure(figsize=(10, 4))

t = np.arange(-2, 3, 1)
x = np.exp(6 * np.pi/5 * t)

tc = np.arange(-2, 2, 0.01)
xc = np.exp(6 * np.pi/5 * tc)

plt.title("Problem 5.4")
plt.stem(t, x, label="x[n]")
plt.plot(tc, xc, "r", alpha=0.8, label="continuous exponential signal")
plt.grid(True)
plt.legend(loc="upper right")
plt.show()
```

e) $x[n] = \exp(j\frac{5\pi}{6}n)$

Solution. Consider the signal:

$$\exp\left(j\frac{5\pi}{6}n\right)$$
 has a period of $N=\frac{2\pi}{\frac{5\pi}{6}}=\frac{12}{5}$

We need to make the period an integer, thus we can multiply the period by 5:

$$N = 5 \cdot \frac{12}{5} = 12$$

Thus, the signal $x[n] = \exp\left(j\frac{5\pi}{6}n\right)$ is **periodic** with a period of N = 12.

By using Python and Matplotlib, we can visualize the periodicity of the signal:

```
import matplotlib.pyplot as plt
import numpy as np

fig = plt.figure(figsize=(10, 4))

t = np.arange(-36, 37, 1)

x = np.exp(1j * 5 * np.pi/6 * t)

tc = np.arange(-36, 36, 0.01)

xc = np.exp(1j * np.pi/6 * tc)

plt.title("Problem 5.5")

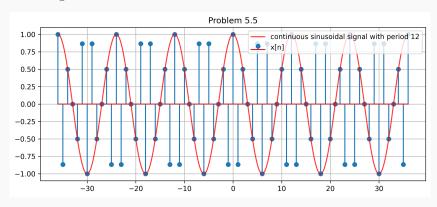

plt.stem(t, x, label="x[n]")

plt.plot(tc, xc, "r", alpha=0.8, label="continuous sinusoidal signal with period 12")

plt.grid(True)

plt.legend(loc="upper right")

plt.show()
```

f)
$$x[n] = \sum_{m=-\infty}^{\infty} [\delta[n-2m] + 2\delta[n-3m]]$$

Solution. Consider the signal, using the properties of the delta function:

1. The first term $\sum_{m=-\infty}^{\infty} \delta[n-2m]$ is a periodic signal with period of 2, since:

$$\sum_{m=-\infty}^{\infty} \delta[n-2m] = \sum_{m=-\infty}^{\infty} \delta[n+2-2m]$$

2. The second term $2\sum_{m=-\infty}^{\infty} \delta[n-3m]$ is a periodic signal with period of 3, since:

$$2\sum_{m=-\infty}^{\infty} \delta[n-3m] = 2\sum_{m=-\infty}^{\infty} \delta[n+3-3m]$$

Thus, the overall signal x[n] is **periodic** with a fundamental period of lcm(2,3) = 6.

By using Python and Matplotlib, we can visualize the periodicity of the signal:

```
import matplotlib.pyplot as plt
import numpy as np

fig = plt.figure(figsize=(10, 4))

t = np.arange(-12, 13, 1)

x1 = np.isin(t \% 2, [0]).astype(float) # delta[n-2k]

x2 = np.isin(t \% 3, [0]).astype(float) # delta[n-3k]

x = x1 + 2 * x2

tc = np.arange(-12, 12, 0.01)

xc = np.exp(1j * np.pi/3 * tc)

plt.title("Problem 5.6")

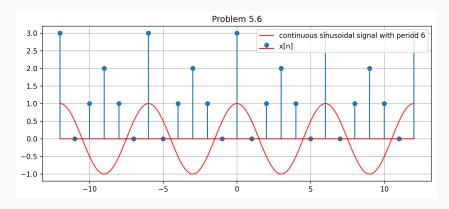

plt.stem(t, x, label="x[n]")

plt.plot(tc, xc, "r", alpha=0.8, label="continuous sinusoidal signal with period 6")

plt.grid(True)

plt.legend(loc="upper right")

plt.show()
```

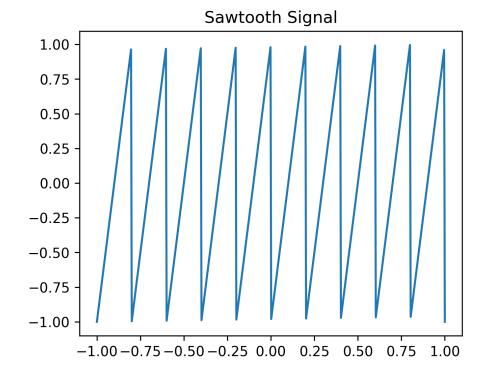

Problem 6. Signal transformations: Study the sawtooth function in the figure below. Apply reflection, scaling, shifting operations to the signal and plot the transformed signals compared with the original sawtooth signal.

```
import numpy as np
from scipy import signal

fig = plt.figure(figsize=(5, 4))

t = np.linspace(-1, 1, 500)
sawtooth = signal.sawtooth(2 * np.pi * 5 * t)

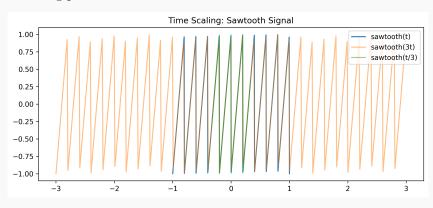

plt.title("Sawtooth Signal")
plt.plot(t, sawtooth)
plt.show()
```

a) time scaling: scaling factor = 3 and 1/3

```
Solution. Using Python and Matplotlib to plot the time-scaled signals:
```

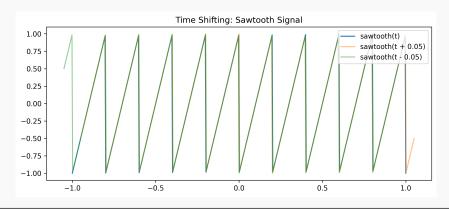

```
import matplotlib.pyplot as plt
2 import numpy as np
3 from scipy import signal
fig = plt.figure(figsize=(10, 4))
7 t = np.linspace(-1, 1, 500)
8 sawtooth = signal.sawtooth(2 * np.pi * 5 * t)
_{10} # scaling factor = 3 and 1/3
## TODO : writing code for time scaling
12
_{13} t1 = t * 3
sawtooth1 = signal.sawtooth(2 * np.pi * 5 * t1)
t2 = t * (1/3)
sawtooth2 = signal.sawtooth(2 * np.pi * 5 * t2)
plt.title("Time Scaling: Sawtooth Signal")
plt.plot(t, sawtooth, label="sawtooth(t)", alpha=1)
plt.plot(t1, sawtooth1, label="sawtooth(3t)", alpha=0.5)
plt.plot(t2, sawtooth2, label="sawtooth(t/3)", alpha=0.5)
plt.legend(loc="upper right")
plt.show()
```

b) time shifting: shifting amount = ± 0.05

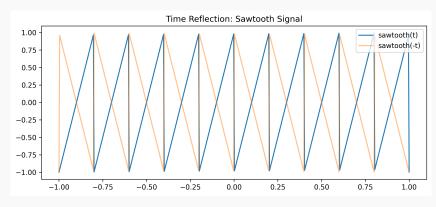

```
{\bf Solution.}\, Using Python and Matplotlib to plot the time-shifted signals:
```

```
import matplotlib.pyplot as plt
2 import numpy as np
3 from scipy import signal
fig = plt.figure(figsize=(10, 4))
7 t = np.linspace(-1, 1, 500)
8 sawtooth = signal.sawtooth(2 * np.pi * 5 * t)
_{10} # scaling factor = 3 and 1/3
## TODO : writing code for time scaling
12
t1 = t + 0.05
  sawtooth1 = signal.sawtooth(2 * np.pi * 5 * t1)
t2 = t - 0.05
sawtooth2 = signal.sawtooth(2 * np.pi * 5 * t2)
plt.title("Time Shifting: Sawtooth Signal")
plt.plot(t, sawtooth, label="sawtooth(t)", alpha=1)
plt.plot(t1, sawtooth1, label="sawtooth(t + 0.05)", alpha
      =0.5)
  plt.plot(t2, sawtooth2, label="sawtooth(t - 0.05)", alpha
      =0.5)
plt.legend(loc="upper right")
plt.show()
```

c) time reflection: reflecting over the y-axis

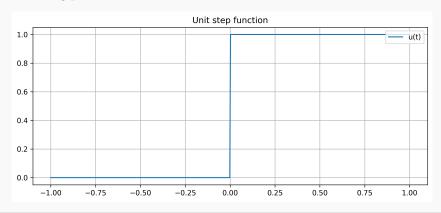

```
Solution. Using Python and Matplotlib to plot the time-reflected signals:
   import matplotlib.pyplot as plt
   2 import numpy as np
   3 from scipy import signal
   fig = plt.figure(figsize=(10, 4))
   7 t = np.linspace(-1, 1, 500)
     sawtooth = signal.sawtooth(2 * np.pi * 5 * t)
   ## TODO : writing code for time Reflection
   11
   12 t1 = t
     sawtooth1 = signal.sawtooth(2 * np.pi * 5 * (-1 * t))
   plt.title("Time Reflection: Sawtooth Signal")
   plt.plot(t, sawtooth, label="sawtooth(t)", alpha=1)
   plt.plot(t1, sawtooth1, label="sawtooth(-t)", alpha=0.5)
   plt.legend(loc="upper right")
     plt.savefig("../images/problem_6_3.png", dpi=300,
         bbox_inches="tight")
   plt.show()
```

Problem 7. Elementary signals: study the ramp signal plotted in the example below. Plot these signals.

a) Writing code for plotting Unit step function

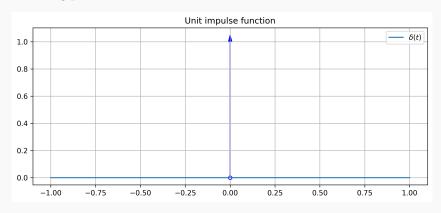

```
Solution. Using Python and Matplotlib to plot the unit step function:
    import matplotlib.pyplot as plt
    2 import numpy as np
     fig = plt.figure(figsize=(10, 4))
     t = np.linspace(-1, 1, 500)
     ## TODO : writing code for plotting unit step function
     def unit_signal(t):
          return 1.0 if t >= 0 else 0.0
     unit_signal_vectorize = np.vectorize(unit_signal)
   13
   x = unit_signal_vectorize(t)
   16
   plt.title("Unit step function")
   plt.plot(t, x, label="u(t)", alpha=1)
   plt.grid(True)
   plt.legend(loc="upper right")
   plt.show()
```

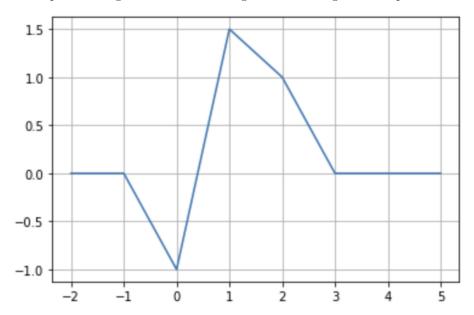

b) Writing code for plotting Unit impulse function

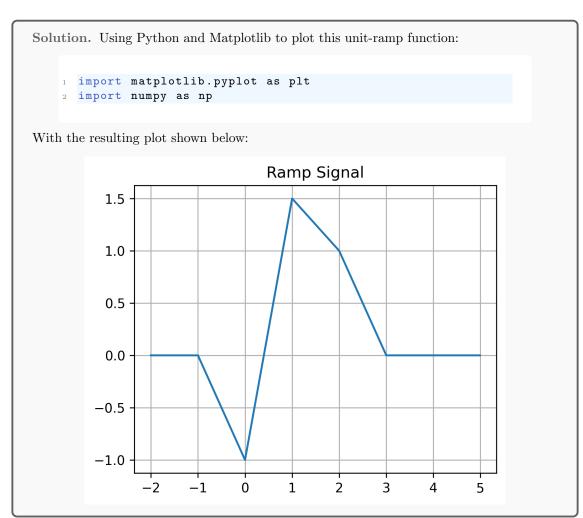

Solution. Using Python and Matplotlib to plot the unit impulse function:

```
import matplotlib.pyplot as plt
2 import numpy as np
  fig = plt.figure(figsize=(10, 4))
  t = np.linspace(-1, 1, 500)
  ## TODO : writing code for plotting unit impulse function
x = np.zeros(t.shape[0])
x[t == 0] = 1
12
arrow = plt.arrow(0, 0, 0, 1, head_width=0.02,
    head_length=0.05, fc='blue', ec='blue')
  origin = plt.plot(0, 0, color='blue', marker = 'o',
     markerfacecolor='white', markersize=5)
plt.title("Unit impulse function")
plt.plot(t, x, label=r"$\delta(t)$", alpha=1)
plt.grid(True)
ppt.legend(loc="upper right")
plt.show()
```

Problem 8. Express the signal that shown in Figure below using Unit-ramp functions

Problem 9. Evaluate the following integrals

a)
$$\int_{-\infty}^{\infty} \left(\frac{2}{3}t - \frac{3}{2}\right) \delta(t-1) dt$$

TO SUBMIT

Solution. Using the sifting property of the delta function, we have:

$$\begin{split} \int_{-\infty}^{\infty} \left(\frac{2}{3}t - \frac{3}{2}\right) \delta(t-1) \, dt &= \left(\frac{2}{3}(1) - \frac{3}{2}\right) \\ &= \frac{2}{3} - \frac{3}{2} \\ \int_{-\infty}^{\infty} \left(\frac{2}{3}t - \frac{3}{2}\right) \delta(t-1) \, dt &= \boxed{-\frac{5}{6}} \end{split}$$

b)
$$\int_{-\infty}^{\infty} (t-1)\delta\left(\frac{2}{3}t - \frac{3}{2}\right) dt$$

Solution. Using the sifting property of the delta function, we have:

$$\int_{-\infty}^{\infty} (t-1)\delta\left(\frac{2}{3}t - \frac{3}{2}\right) dt = \int_{-\infty}^{\infty} (t-1)\delta\left(t - \frac{9}{4}\right) \cdot \left|\frac{d}{dt}\left(\frac{2}{3}t - \frac{3}{2}\right)\right|^{-1} dt$$

$$= \int_{-\infty}^{\infty} (t-1)\delta\left(t - \frac{9}{4}\right) \cdot \frac{3}{2} dt$$

$$= (\frac{9}{4} - 1) \cdot \frac{3}{2}$$

$$= \frac{5}{4} \cdot \frac{3}{2} = \frac{15}{8}$$

$$\int_{-\infty}^{\infty} (t-1)\delta\left(\frac{2}{3}t - \frac{3}{2}\right) dt = \boxed{\frac{15}{8}}$$

c)
$$\int_{-3}^{-2} \left[e^{(-t+1)} + \sin\left(\frac{2\pi t}{3}\right) \right] \delta\left(t - \frac{3}{2}\right) dt$$

TO SUBMIT

Solution. Because the argument of the delta function $t - \frac{3}{2}$ has its root at $t = \frac{3}{2}$, which is outside the integration limits of -3 to -2, the integral evaluates to zero:

$$\int_{-3}^{-2} \left[e^{(-t+1)} + \sin\left(\frac{2\pi t}{3}\right) \right] \delta\left(t - \frac{3}{2}\right) dt = \boxed{0}$$

d)
$$\int_{-3}^{2} \left[e^{(-t+1)} + \sin\left(\frac{2\pi t}{3}\right) \right] \delta\left(t - \frac{3}{2}\right) dt$$

Solution. Using the sifting property of the delta function, we have:

$$\int_{-3}^{2} \left[e^{(-t+1)} + \sin\left(\frac{2\pi t}{3}\right) \right] \delta\left(t - \frac{3}{2}\right) dt = \left[e^{(-\frac{3}{2}+1)} + \sin\left(\frac{2\pi(\frac{3}{2})}{3}\right) \right]$$

$$= e^{-\frac{1}{2}} + \sin(\pi)$$

$$= e^{-\frac{1}{2}} + 0$$

$$\int_{-3}^{2} \left[e^{(-t+1)} + \sin\left(\frac{2\pi t}{3}\right) \right] \delta\left(t - \frac{3}{2}\right) dt = \boxed{e^{-\frac{1}{2}}}$$
